Project Profile

Project: Starbucks #3

Profile: Lythic Polished Concrete Products

Materials: Lythic XL Densifier
Lythic Protector
Lythic Cleaner

Location: China

Overview: The construction was unique with precast polished concrete panels being used for the floors and walls. A polishable overlay was used with oversized white aggregate that was ground and polished off site. The wall and floor panels were then fixed in place before a final clean and polish.

Lythic XL Densifier was used during the grind and polishing stages to harden the cementitious overlay. Lythic protector was applied when everything was completed. Lythic Cleaner is used to maintain the floor on a daily basis and when coffee or food is spilled.
